

ABSTRACT OF THE DISCLOSURE

A data reproduction apparatus which reproduces data based on script data, in which a script execution location specifying section modifies the execution location held in a table when output data from an output section that outputs an input code, time code or clock data coincides with an input code, time code or clock data held in a table; and a script analysis and execution section executes processing that corresponds to the commands of the script data, and, it further controls reproduction of data according to reproduction instructions specified at the execution location that is modified by the script execution location specifying section when the output data coincides with the input code, time code or clock data held in the table.
